4. If $A=\left(\begin{array}{c}-2 \\ 4 \\ 5\end{array}\right)$ and $B=\left(\begin{array}{lll}1 & 3 & -6\end{array}\right)$ then verify that $(A B)^{\top}=B^{\top} A^{\top}$.

## Solution:

$$
\begin{align*}
\mathrm{AB} & =\left(\begin{array}{c}

$$

From (1) and (2) we get $(A B)^{\top}=B^{\top} A^{\top}$
5. If $A=\left(\begin{array}{ll}5 & 2 \\ 7 & 3\end{array}\right)$ and $B=\left(\begin{array}{cc}2 & -1 \\ -1 & 1\end{array}\right)$ verify that $(A B)^{\top}=B^{\top} A^{\top}$.

Solution :

$$

$$

From (1) and (2), we get

$$
(A B)^{\top}=B^{\top} A^{\top}
$$

6. If $A=\left(\begin{array}{cc}1 & -1 \\ 2 & 3\end{array}\right)$ then show that $A^{2}-4 A+5 I_{2}=0$

$$

$$

$$
A^{2}-4 A+5 I_{2}=0
$$

7. If $A=\left(\begin{array}{cc}3 & 2 \\ -1 & 4\end{array}\right), B=\left(\begin{array}{cc}-2 & 5 \\ 6 & 7\end{array}\right)$ and $C=\left(\begin{array}{cc}1 & 1 \\ -5 & 3\end{array}\right)$. Verify that $A(B+C)=A B+A C$.

## Solution:

$$
B+C=\left(\begin{array}{cc}
-2 & 5 \\
6 & 7
\end{array}\right)+\left(\begin{array}{cc}
1 & 1 \\
-5 & 3
\end{array}\right)=\left(\begin{array}{cc}

1 & 10

$$

$$
\begin{align*}
A(B+C) & =\left(\begin{array}{cc}

& =\left(\begin{array}{cc}
-6+12 & 15+14 \\

& =\left(\begin{array}{cc}

\end{array}\right) \\
A C & =\left(\begin{array}{cc}

& =\left(\begin{array}{cc}

A B+A C & =\left(\begin{array}{cc}

-7 & 9 \\
-21 & 11
\end{array}\right) \\
& =\left(\begin{array}{cc}
-1 & 38 \\
5 & 34
\end{array}\right) \tag{2}
\end{align*}
$$

From (1) and (2) we get
$A(B+C)=A B+A C$

## 5. COORDINATE GEOMETRY

1. Find the points of trisection of the line segment joining the points $A(2,-2)$ and $B(-7,4)$.

Let $P$ and $Q$ be the points of trisection of $A B$ such that $A P=P Q=Q B$. Then the point $P$ divides $A B$ internally in the ratio $1: 2$ and $Q$ divides $A B$ internally in the ratio $2: 1$

$$
\begin{aligned}
P & =\left(\frac{1 \times(-7)+(2 \times 2)}{1+2}, \frac{(1 \times 4)+2(-2)}{1+2}\right) \\
& =\left(\frac{-7+4}{3}, \frac{4-4}{3}\right)=(-1,0)
\end{aligned}
$$

Thus, the point $P$ is $(-1,0)$ Again by section formula

$$
\begin{aligned}
Q & =\left(\frac{2 \times(-7)+(1 \times 2)}{2+1}, \frac{(2 \times 4)+1 \times(-2)}{2+1}\right) \\
& =(-4,2)
\end{aligned}
$$

Thus the point $Q$ is $(-4,2)$
2. Find the points which divide the line segment joining $A(-4,0)$ and $(0,6)$ into four equal parts.

Let $P, Q, R$ be the points which divide $A B$ into four equal parts.

The point $Q$ is the midpoint of $A B$

$$
Q=\left(\frac{-4+0}{2}, \frac{0+6}{2}\right)=(-2,3)
$$

now $P$ is the midpoint of $A Q$.

$$
\begin{aligned}
& P=\left(\frac{-4-2}{2}, \frac{0+3}{2}\right) \\
& P=\left(\frac{-6}{2}, \frac{3}{2}\right)=\left(-3, \frac{3}{2}\right)
\end{aligned}
$$

$R$ is the midpoint of $Q B$.

$$
\mathrm{R}=\left(\frac{-2+0}{2}, \frac{3+6}{2}\right)=\left(-1, \frac{9}{2}\right)
$$

$$
\text { Hence the required points are } P=\left(-3, \frac{3}{2}\right) Q=(-2,3) R=\left(-1, \frac{9}{2}\right)
$$

3. In what ratio is the line joining the points $(-5,1)$ and $(2,3)$ divided by the $y$-axis. Also find the point of intersection.

Let $A(-5,1)$ and $B(2,3)$ be the given points.
Let $\mathrm{P}(0, \mathrm{y})$ divide AB internally in the ratio $\ell$ : m . By section formula.

$$
\begin{align*}
& \mathrm{P}(0, \mathrm{y})=\mathrm{P}\left(\frac{(\ell \times 2)+(\mathrm{m} \times(-5)}{\ell+\mathrm{m}}, \frac{(\ell \times 3)+\mathrm{m} \times 1)}{\ell+\mathrm{m}}\right)  \tag{1}\\
& \mathrm{P}(0, \mathrm{y})=\mathrm{P}\left(\frac{2 \ell-5 \mathrm{~m}}{\ell+\mathrm{m}}, \frac{3 \ell+\mathrm{m}}{\ell+\mathrm{m}}\right) \quad---(1)
\end{align*}
$$

Equating $x$ coordinates to zero.

$$
\frac{2 \ell-5 m}{\ell+m}=0 \Rightarrow 21-5 m=0 \Rightarrow \frac{\ell}{m}=\frac{5}{2}
$$

The required ratio is $5: 2$
Also from (1) we have $P(0, y)=P\left(0, \frac{(5 \times 3)+(2 \times 1)}{5+2}\right)$

$$
=P\left(0, \frac{17}{7}\right)
$$

Hence the required point of intersection is $\left(0, \frac{17}{7}\right)$

$$
\ell: \mathrm{m}=5: 2 \text { and } \mathrm{P}(0, \mathrm{y})=\mathrm{P}(0,17 / 4)
$$

4. Find the length of the medians of the triangle whose vertices are $(1,-1),(0,4)$ and $(-5,3)$.

## Solution :

Let $A(1,-1), B(0,4) C(-5,3)$ be the vertices of the triangle.
Let $D, E, F$ be the mid points of $B C, A C$ and $A B$.

$$
\begin{aligned}
& \text { The midpoint of } B C \text { is } \quad D=\left(\frac{0-5}{2}, \frac{4+3}{2}\right)=D\left(\frac{-5}{2}, \frac{7}{2}\right) \\
& \text { The midpoint of } A C \text { is } \quad E=\left(\frac{1-5}{2}, \frac{-1+3}{2}\right)=E(-2,1) \\
& \text { The midpoint of } A B \text { is } \\
&
\end{aligned}
$$

$$
\text { The length of the median } \mathrm{AD}=\sqrt{\left(1+\frac{5}{2}\right)^{2}+\left(-1-\frac{7}{2}\right)^{2}}
$$

$$
=\sqrt{\left(\frac{7}{2}\right)^{2}+\left(\frac{-9}{2}\right)^{2}}=\sqrt{\frac{49}{4}+\frac{81}{4}}=\sqrt{\frac{130}{4}}
$$

The length of the median BE $=\sqrt{(2-0)^{2}+(1-4)^{2}}=\sqrt{4+9}==\sqrt{13}$
The length of the median $C F=\sqrt{\left(\frac{1}{2}+5\right)^{2}+\left(\frac{3}{2}-3\right)^{2}}=\sqrt{\left(\frac{11}{2}\right)^{2}+\left(\frac{-3}{2}\right)^{2}}=\sqrt{\frac{121}{4}+\frac{9}{4}}=\sqrt{\frac{130}{4}}$
Thus the length of medians of the $\triangle \mathrm{ABC}$ are $\frac{\sqrt{130}}{2}, \sqrt{13}, \frac{\sqrt{130}}{2}$
5. Find the area of the quadrilateral whose vertices are (6, 9), (7, 4), (4,2) and (3,7).

Plot the given points in a rough diagram and take the vertices in counter clockwise direction.
Let the given points be $A(4,2), B(7,4), C(6,9), D(3,7)$.
Area of the quadrilateral $A B C D$.

$$
\begin{aligned}
& =\frac{1}{2}\{\overbrace{2}^{4}>_{4}^{7} \gg_{9}^{6}>_{2}^{3} \\
& =\frac{1}{2}[(16+63+42+6)-(14+24+27+28)] \\
& =\frac{1}{2}[127-93] \\
& =\frac{1}{2} \times 34 \\
& =17
\end{aligned}
$$

Thus the area of the quadriateral $A B C D$ is 17 sq. units.
6. Find the area of the quadrilateral whose vertices are $(-4,5)(0,7)(5,-5)$ and $(-4,-2)$.

Plot the given points in a rought diagram and take the vertices in counter clockwise direction.
Area of the quadrilateral ABCD

$$
\begin{aligned}
& =\frac{1}{2}\left\{\begin{array}{ccccc}
-4 & 5 & 0 & -4 & -4 \\
-2 & -5 & 7 & 5 & -2
\end{array}\right\} \\
& =\frac{1}{2}[(20+35+0+8)-(-10+0-28-20)] \\
& =\frac{1}{2}[63+58] \\
& =\frac{1}{2} \times 121 \\
& =60.5
\end{aligned}
$$

Thus, the area of the quadrilateral $A B C D$ is 605 sq.units.
7. Find the value of $k$ for which the given points are collinear $(2,-5)(3,-4)$ and $(9, k)$.

Let the given points be $\mathrm{A}(2,-5) \mathrm{B}(3,-4) \mathrm{C}(9, k)$.
The given points are collinear.
Thus area of $\triangle A B C=0$

$$
\begin{aligned}
D & =\frac{1}{2}\left[{ }_{-5}^{2}>_{-4}^{3}>_{k}^{2}\right]=0 \\
D & =\frac{1}{2}[(-8+3 k-45)-(-15-36+2 k)]=0 \\
D & =\frac{1}{2}[-53+3 k+51-2 k]=0 \\
D & =-2+k=0 \\
k-2 & =0 \\
k & =2
\end{aligned}
$$

Thus the value of k is 2 .
8. Find the area of the triangle formed by joining the midpoints of the sides of a triangle whose vertices are $(0,-1),(2,1)$ and $(0,3)$. Find the ratio of this area to the area of the given triangle.

Vertices are $(0,-1), 2,1),(0,3)$ find the ratio of this area to the area of the given triangle.
Let the vertices of the triangle be $\mathrm{a}(0,-1) \mathrm{B}(2,1)$ and $\mathrm{C}(0,3)$.
Let $D, E, F$ be the mid points of the sides $B C, C A$ and $A B$ respectively.
$D$ is the mid point of $B C$
The mid point of $B C$ is $D=\left(\frac{2+0}{2}, \frac{1+3}{2}\right)=D(1,2)$
The mid point of $A C$ is $E=\left(\frac{0+0}{2}, \frac{3-1}{2}\right)=E(0,1)$
The mid point of $A B$ is $F=\left(\frac{0+2}{2}, \frac{-1+1}{2}\right)=F(1,0)$
Thus Area of $\triangle \mathrm{DEF}=\frac{1}{2}\left\{\begin{array}{llll}1 & 0 & 1 & 1 \\ 2 & 1 & 0 & 2\end{array}\right\}$

$$
=\frac{1}{2}[(1+0+2)-(0+1+0)]=1 \text { sq. unit }
$$

Thus area of $\triangle D E F$ is 1 sq. units
Area of $\triangle \mathrm{ABC}=\frac{1}{2}\left\{\begin{array}{cccc}2 & 0 & 0 & 2 \\ 1 & 3 & -1 & 1\end{array}\right\}$

$$
\begin{aligned}
& =\frac{1}{2}[(6+0+0)-(0+0-2)] \\
& =4 \text { sq. units }
\end{aligned}
$$

Thus the area of the $\triangle A B C$ is 4 sq.units. Hence, the ratio of the area of $\triangle D E F$ to the area of $\triangle A B C$ is 1:4
9. The vertices of $\triangle A B C$ are $A(1,8), B(-2,4), C(8,-5)$. If $M$ and $N$ are the mid points of $A B$ and $A C$ respectively, find the slope of $M N$ and hence verify that $M N$ is parallel to $B C$.

Mid point $M$ of $A B$ is

$$
\begin{aligned}
M & =\left(\frac{1-2}{2}, \frac{8+4}{2}\right) \\
& =\left(\frac{-1}{2}, 6\right)
\end{aligned}
$$

Mid point N of AC is

$$
\begin{aligned}
& \mathrm{N}=\left(\frac{1+8}{2}, \frac{-5+8}{2}\right) \\
& \mathrm{N}=\left(\frac{9}{2}, \frac{3}{2}\right)
\end{aligned}
$$

The slope of the line $M N$ is $M_{1}=\frac{\frac{3}{2}-6}{\frac{9}{2}+\frac{1}{2}}=\frac{\frac{3-12}{2}}{\frac{10}{2}}=\frac{-9}{10}$
Also the slope of $B C$ is $M_{2}=\frac{-5-4}{8+2}=\frac{-9}{10}$
We have $M_{1}=M_{2}$
Hence, the straight lines $B C$ and $M N$ are parallel.
10. A triangle has vertices at $(6,7),(2,-9)$ and $(-4,1)$. Find the slopes of its medians.

Let the vertices be $A(6,7), B(2,-9) C(-4,1)$
Let $D, E, F$ be the midpoints of $B C, C A, A B$ resp. then $A D, B E$ and $C F$ are the medians of the $\triangle A B C$.

$$
\text { The Mid point of } \begin{aligned}
B C \text { is } D & =\left(\frac{2-4}{2}, \frac{-9+1}{2}\right) \\
& =(-1,-4)
\end{aligned}
$$

The midpoint of CA is $\mathrm{E}\left(\frac{-4+6}{2}, \frac{1+7}{2}\right)$

$$
E=(1,4)
$$

The midpoint of $A B$ is $F\left(\frac{6+2}{2}, \frac{7-9}{2}\right)$

$$
F=(4,-1)
$$

Slope of $A D=\frac{-4-7}{-1-6}=\frac{-11}{-7}=\frac{11}{7}$
Slope of $B E=\frac{4+9}{1-2}=\frac{13}{-1}=-13$
Slope of $C F=\frac{-1-1}{4+4}=\frac{-2}{8}=\frac{-1}{4}$
Slopes of the medians are $\frac{11}{7},-13$ and $\frac{-1}{4}$.
11. The line joining the points $A(-2,3)$ and $B(a, 5)$ is parallel to the line joining the points $C(0,5)$ and $D(-2,1)$. Find the value of ' $a$ '.

Since the lines $A B$ and $C D$ are parallel their slopes are equal.
Thus slope of $A B=$ The slope of $C D$.
Slope of $A B=\frac{5-3}{a+2}=\frac{2}{a+2}$
Slope of $C D=\frac{1-5}{-2-0}=\frac{-4}{-2}=2$
Equating the above

$$
\begin{aligned}
& \frac{2}{a+2}=2 \\
& a+2=1 \\
& a=1-2 \\
& a=-1
\end{aligned}
$$

Hence, the value of $a=-1$
12. Find the equation of the straight line passing through the point $(2,2)$ and the sum of the intercepts is 9 .

## Solution:

Let x and y intercepts of the straight line be a and b respectively.
Then
$a+b=9$ or $b=9-a$
Now, the equation of the straight line in intercepts from is $\frac{x}{a}+\frac{y}{b}=1$
Since I passes through $(2,2)$ we have $\frac{2}{a}+\frac{2}{9-a}=1$

$$
\begin{aligned}
& \Rightarrow \quad a^{2}-9 a+18=0 \\
& \Rightarrow \quad(a-6)(a-3)=0
\end{aligned}
$$

Thus $\mathrm{a}=6$ or $\mathrm{a}=3$
when $\mathrm{a}=3$ from the equation I we have $\frac{x}{3}+\frac{\mathrm{y}}{6}=1 \Rightarrow 2 x+\mathrm{y}-6=0$
when $\mathrm{a}=6$ from the equation I we have $\frac{x}{6}+\frac{\mathrm{y}}{3}=1 \Rightarrow x+2 \mathrm{y}-6=0$
13. Find the equation of the line whose gradient is $\frac{3}{2}$ and which passes through $P$, where $P$ divides the line segment joining $A(-2,6)$ and $B(3,-4)$ in the ratio $2: 3$ internally.

The point $P$ divides $A B$ in the ratio $2: 3$ internaly.
Thus the point $P$ is $\left(\frac{2(3)+3(-2)}{2+3}, \frac{2(-4)+3(6)}{2+3}\right)$

$$
=(2,0)
$$

Hence equation of the straight line passing through $(0,2)$ with slope $\frac{3}{2}$ is

$$
\begin{aligned}
& y-2=\frac{3}{2}(x-0) \\
& 2 y-4=3 x \\
& 3 x-2 y+4=0
\end{aligned}
$$

14. Find the equation of the straight line joining the point of inter section of the lines $3 x-y+9=0$ and $x+2 y=4$ and the point of intersection of the lines $2 x+y-4=0$ and $x-2 y+3=0$

Given equations can be written as
$3 x-y=-9$
----- (I)
$x+2 y=4$
$2 x+y=4$
$x-2 y=-3$

Solving I and II

$$
\begin{aligned}
& 3 x-y=-9 \\
& x+2 y=4
\end{aligned}
$$

$(1 \times 2)+I I$
$6 x-2 y=-18$
Put $x=-2$ we get
$x-2 y=-4$
$7 x=-14$

$$
\begin{aligned}
& -2+2 y=4 \\
& 2 y=4+2 \\
& y=6 / 2 \quad y=3
\end{aligned}
$$

Point of intersection is $(-2,3)$
Solving III \& IV $2 x+y=4$

$$
\begin{equation*}
x-2 y=-3 \tag{III}
\end{equation*}
$$

(III x 2) + IV

$$
\begin{array}{cc}
4 x+2 y=8 & \\
x-2 y=-3 & \\
5 x=5 \quad x=1
\end{array}
$$

$$
\begin{equation*}
\text { Put } x=1 \tag{IV}
\end{equation*}
$$

$$
1-2 y=-3
$$

$$
-2 y=-4
$$

$$
y=2
$$

The point of intersection is $(1,2)$
The equation of the straight line joining $(-2,3)$ and $(1,2)$ is

$$
\begin{aligned}
& \quad \frac{y-3}{2-3}=\frac{x+2}{1+2} \Rightarrow \frac{y-3}{-1}=\frac{x+2}{3} \\
& \quad \Rightarrow x+3 y-7=0 \\
& M=\left(\frac{3-5}{2}, \frac{-2+8}{2}\right) \\
& =(-1,3)
\end{aligned}
$$

15. If the vertices of a $\triangle A B C$ are $A(2,-4), B(3,3)$ and $C(-1,5)$, then find the equation of the straight line along the altitude from the vertex $B$.

Let $B D$ be the altitude from the vertex $B$
Now the slope of $A C$ is $\frac{5+4}{-1-2}=\frac{9}{-3}=-3$
Thus, the slope of the straight line along te altitude $B D$ is $\frac{1}{3}(A C \perp B D)$
Now, the required line is passing through $(3,3)$ with slope $\frac{1}{3}$.
The required equation is $y-3=\frac{1}{3}(x-3)$

$$
3 y-9=x-3 \Rightarrow x-3 y+6=0
$$

16. If the vertices of a $\triangle A B C$ are $A(-4,4) B(8,4) C(8,10)$ then find the equation of the straight line along the median from the vertex $A$.

Let $A D$ be the median through the vertex.
Midpoint $D$ of $B C$ is $D\left(\frac{8+8}{2}, \frac{4+10}{2}\right)$

$$
\mathrm{D}=(8,7)
$$

The equation of the median $A D$ joining $A(-4,4) D(8,7)$ is

$$
\begin{aligned}
\frac{y-4}{7-4}=\frac{x+4}{8+4} & \Rightarrow 4 y-16=x+4 \\
& \Rightarrow x-4 y+20=0
\end{aligned}
$$

## Solution:

Given that $2 r=84 \mathrm{~m} \Rightarrow r=42 \mathrm{~cm}, \mathrm{~h}=120 \mathrm{~cm}$
Area covered by the roller in one revolution $=2 \pi r h$

$$
\begin{aligned}
